Cellular Automata Exercise

Phileas Dazeley Gaist

2/26/2022

Take this cellular automata rule:

Fig. 27.18 CA rule 182.

```
# let's define the row of cells at timestep n = 0
# HERE IS WHERE YOU CHANGE INITIAL CONDITIONS
# I have included some fun suggestions:
# initial\_conditions \leftarrow rep(c(0, 1, 1, 0), 52)
# initial\_conditions \leftarrow rep(c(0, 1, 0), 52)
# initial\_conditions \leftarrow sample(c(0, 1), 100, replace = T)
# initial_conditions[length(initial_conditions) %/% 2] <- 1</pre>
# the Fibonacci initial conditions
# width <- 100 # approximate width
# fibb <- c(1)
# while(sum(fibb)<width){</pre>
    fibb <- c(fibb, sum(tail(fibb, 2)))</pre>
# }
# initial_conditions <- c()</pre>
# for(i in fibb){
# initial\_conditions \leftarrow c(initial\_conditions, rep(sample(c(0, 1), 1), length=i))
# }
# inverting copier initial conditions / flipper machine initial conditions (start with F, next
# iterations <- 7
# initial_conditions <- c(F)</pre>
# for(i in 1:iterations){
# initial_conditions <- c(initial_conditions, !initial_conditions)
# }
```

```
initial_conditions <- rep(0, 101)
 initial_conditions[(length(initial_conditions) %/% 2)] <- 1</pre>
  # initial_conditions[1] <- initial_conditions[length(initial_conditions)] <- 1</pre>
  # and let's decide how many timesteps to apply the rule
 n <- 70
last_conditions <- new_conditions <- data <- initial_conditions</pre>
 x <- rep(0:(length(initial_conditions)-1), n+1)
 y <- rep(0:n, each=length(initial_conditions))</pre>
 for(i in 1:n){
                       for(j in 1:length(new_conditions)){
                                            # check if the cell has left or right neighbours
                                          left_neighbour <- F; right_neighbour <- F</pre>
                                            if(j>1){left_neighbour <- T}</pre>
                                            if(j<length(new_conditions)){right_neighbour <- T}</pre>
